

New paper: An estimated 13 million people worldwide killed by the COVID vaccines

That's twice as many as were killed by the virus. In the US, the estimates are 670K Americans killed. Perhaps it's time to declare that the vaccines are a worldwide emergency?

Executive summary

The paper suggests you can take the number of vaccine doses delivered, divide by 1,000 to get an estimate of the number of people killed by the COVID vaccine.

The tweet directly from the author sums it up:

The details

The [paper](#): [Age-stratified COVID-19 vaccine-dose fatality rate for Israel and Australia](#)

The [full story about how universities undermine people like Denis Rancourt who tell the truth](#)

The main result

The paper finds that the vDFR (vaccine-dose fatality rate) is exponential with respect to age.

The paper points out that **“it is not unreasonable to assume an all-population global value of vDFR = 0.1 %”**

For the US, 670M doses have been given, so the estimate is 670,000 people have been killed by the COVID vaccines in the US.

I have said for a long time that the URF in VAERS is 41, and there are 16,300 excess US deaths in VAERS (subtracting 250 background deaths per year which gets reported into VAERS) which comes to 668K.

668K is very close to 670K, isn't it?

What an amazing "coincidence"!

A third method gives a similar result

Marc Girardot Writes Covid Myth Buster Series just now

Steve,

My calculation comes very close:

5% of shots go intravascular (2% with trained pros and aspiration, Pr Hoiby in Denmark stated 60% reduction with aspiration so $2\% / (1-60\%) = 5\%$)

20% of those are very severe as per a study on Steroid shots going inadvertently IV (likely a higher dose gets through) = 1% of doses have severe adverse effects (consistent with Pr Müller's 2.8% clinical heart issues after 2 doses)

As per the data of age of death, stating that 10% of the population is more at risk of dying: 0.1% die rapidly within a year.

So yeah, 670k death in the US is a reasonable estimate. This is just the tip of the iceberg: 33 million pple harmed and at risk of Alzheimer's disease.

Summary

The paper gives a simple way to estimate the number of people a country has killed by deploying the COVID vaccines: $0.001 * \#$ of doses.

In short, you can just take the number of vaccine doses in millions and just change "millions" to "thousands" to estimate the number of people killed by the vaccine.

Using data from Israel and Australia, the paper estimates 13 million deaths worldwide from the COVID vaccines:

The COVID-19 vaccines did not only not save lives but they are highly toxic.

On the global scale, given the 3.7 million fatalities in India alone, having $vDFR = 1\%$ (Rancourt, 2022), and given the age-stratified $vDFR$ results presented in this work, it is not unreasonable to assume an all-population global value of $vDFR = 0.1\%$. Based on the global number of COVID-19 vaccine doses administered to date (13.25 billion 24 doses, up to 24 January 2023, Our World in Data),³ this would correspond to **13 million deaths from the COVID-19 vaccines worldwide**. By comparison, the official World Health Organization

(WHO) number of COVID-19 deaths to date is 6.8 million (6,817,478 deaths, reported to WHO, as 3 February 2023),⁴ which are not detected as COVID-19 assignable deaths in ACM studies.
